# Order(N) methods in QMC 

## Dario Alfè

[d.alfe@ucl.ac.uk]

## Monte Carlo methods

- Evaluation of multidimensional integrals:
- Quadrature methods, error ~ $\mathrm{M}^{-4 / \mathrm{d}}$
- Monte Carlo methods, error $\sim \mathrm{M}^{-0.5}$

$$
\begin{gathered}
\mathrm{I}=\int \mathrm{d} \mathbf{R} g(\mathbf{R}) \\
\wp(\mathbf{R}) \geq 0 ; \quad \int \mathrm{d} \mathbf{R} \wp(\mathbf{R})=1 \\
\mathrm{I}=\int \mathrm{d} \mathbf{R} f(\mathbf{R}) \wp(\mathbf{R}) ; \quad f(\mathbf{R})=g(\mathbf{R}) / \wp(\mathbf{R}) \\
\mathrm{I}=\lim _{M \rightarrow \infty}\left\{\frac{1}{M} \sum_{m=1}^{M} f\left(\mathbf{R}_{m}\right)\right\} \approx \frac{1}{M} \sum_{m=1}^{M} f\left(\mathbf{R}_{m}\right)
\end{gathered}
$$

## Variational Monte Carlo

$$
\begin{gathered}
E_{V}=\frac{\int \Psi_{T}^{*}(\mathbf{R}) \hat{H} \Psi_{T}(\mathbf{R}) d \mathbf{R}}{\int \Psi_{T}^{*}(\mathbf{R}) \Psi_{T}(\mathbf{R}) d \mathbf{R}} \geq E_{0} \\
E_{V}=\frac{\int\left|\Psi_{T}(\mathbf{R})\right|^{2}\left[\Psi_{T}(\mathbf{R})^{-1} \hat{H} \Psi_{T}(\mathbf{R})\right] d \mathbf{R}}{\int\left|\Psi_{T}(\mathbf{R})\right|^{2} d \mathbf{R}} \\
\wp(\mathbf{R})=\left|\Psi_{T}(\mathbf{R})\right|^{2} / \int\left|\Psi_{T}(\mathbf{R})\right|^{2} d \mathbf{R} \\
E_{V} \approx \frac{1}{M} \sum_{m=1}^{M} E_{L}\left(\mathbf{R}_{m}\right) ; \quad E_{L}\left(\mathbf{R}_{m}\right)=\Psi_{T}\left(\mathbf{R}_{m}\right)^{-1} \ddot{\varphi} \Psi_{T}\left(\mathbf{R}_{m}\right)
\end{gathered}
$$

## Diffusion Monte Carlo

$$
-\frac{\partial \Psi(\mathbf{R}, t)}{i \partial t}=\left(\hat{H}-E_{T}\right) \Psi(\mathbf{R}, t)
$$

Extracting the ground state: substitute $\tau=$ it

$$
\tau \rightarrow \infty, \quad \Psi(\mathbf{R}, \tau) \rightarrow \Phi_{0}(\mathbf{R})
$$

Fixed nodes:

$$
\begin{gathered}
\tau \rightarrow \infty, \quad \Psi(\mathbf{R}, \tau) \rightarrow \Phi_{0}^{F N}(\mathbf{R}) \\
\Psi_{T}(\mathbf{R})=\exp [J(\mathbf{R})] \sum_{n} c_{n} D_{n}^{\uparrow}\left\{\phi_{i}\left(\mathbf{r}_{j}\right)\right\} D_{n}^{\downarrow}\left\{\phi_{i}\left(\mathbf{r}_{j}\right)\right\}
\end{gathered}
$$

## Cost of evaluating $\Psi_{T}$

$$
\Psi_{T}(\mathbf{R})=\exp [J(\mathbf{R})] \sum_{n} c_{n} D_{n}^{\uparrow}\left\{\phi_{i}\left(\mathbf{r}_{j}\right)\right\} D_{n}^{\downarrow}\left\{\phi_{i}\left(\mathbf{r}_{j}\right)\right\}
$$

- N electrons
- $N$ single particle orbitals $\phi_{i}$
- ~ N basis functions for each $\phi_{i}$ if

$$
\phi_{i}\left(\mathbf{r}_{j}\right)=\sum_{\mathbf{G}} c_{\mathbf{G}} \exp \left\{-i \mathbf{G} \cdot \mathbf{r}_{j}\right\}
$$

Cost proportional to $\mathbf{N}^{\mathbf{3}}$

## Cost of evaluating Energy E

Variance of E is proportional to $\mathrm{N} \rightarrow$
Cost of total energy proportional to $\mathbf{N}^{4}$

## HOWEVER <br> Variance of E/atom is proportional to $1 / \mathrm{N} \rightarrow$

Cost of energy/atom proportional to $\mathbf{N}^{2}$
(relevant to free energies in phase transitions, surface energies, ....)

## Cost of evaluating $\Psi_{T}$

$$
\Psi_{T}(\mathbf{R})=\exp [J(\mathbf{R})] \sum_{n} c_{n} D_{n}^{\uparrow}\left\{\phi_{i}\left(\mathbf{r}_{j}\right)\right\} D_{n}^{\downarrow}\left\{\phi_{i}\left(\mathbf{r}_{j}\right)\right\}
$$

- N electrons
- $N$ single particle orbitals $\phi_{i}$
- ~ N basis functions for each $\phi_{i}$ if

$$
\phi_{i}\left(\mathbf{r}_{j}\right)=\sum_{\mathbf{G}} c_{\mathbf{G}} \exp \left\{-i \mathbf{G} \cdot \mathbf{r}_{j}\right\}
$$

## Cost proportional to $\mathbf{N}^{\mathbf{3}}$

## Cost of evaluating $\Psi_{T}$

$$
\Psi_{T}(\mathbf{R})=\exp [J(\mathbf{R})] \sum_{n} c_{n} D_{n}^{\uparrow}\left\{\phi_{i}\left(\mathbf{r}_{j}\right)\right\} D_{n}^{\downarrow}\left\{\phi_{i}\left(\mathbf{r}_{j}\right)\right\}
$$

- N electrons
- $N$ single particle orbitals $\phi_{i}$
- ~ o(1) basis functions for each $\phi_{i}$ if

$$
\phi_{i}\left(\mathbf{r}_{j}\right)=\sum_{l} c_{l} f_{l}\left(\mathbf{r}_{j}\right) \quad \begin{aligned}
& \text { if } f_{l}(\mathbf{r}) \text { is } \\
& \text { localised }
\end{aligned}
$$

Cost proportional to $\mathbf{N}^{\mathbf{2}}$

## Cost of evaluating Energy E

Variance of E is proportional to $\mathrm{N} \rightarrow$
Cost of total energy proportional to $\mathbf{N}^{\mathbf{3}}$

## HOWEVER <br> Variance of E/atom is proportional to $1 / \mathrm{N} \rightarrow$

Cost of energy/atom proportional to $\mathbf{N}$
(relevant to free energies in phase transitions, surface energies, ....)

## AUC.

## B-splines: Localised functions sitting at the points of a uniform grid

$$
\begin{aligned}
f(x) & =1-\frac{3}{2} x^{2}+\frac{3}{4}|x|^{3} & & 0 \leq|x| \leq 1 \\
& =\frac{1}{4}(2-|x|)^{3} & & 1 \leq|x| \leq 2
\end{aligned}
$$

E. Hernàndez, M. J. Gillan and C. M. Goringe, Phys. Rev. B, 20 (1997)
D. Alfè and M. J. Gillan, Phys. Rev. B, Rapid Comm., 70, 161101, (2004)

## Cost of evaluating $\Psi_{T}$

$$
\Psi_{T}(\mathbf{R})=\exp [J(\mathbf{R})] \sum_{n} c_{n} D_{n}^{\uparrow}\left\{\phi_{i}\left(\mathbf{r}_{j}\right)\right\} D_{n}^{\downarrow}\left\{\phi_{i}\left(\mathbf{r}_{j}\right)\right\}
$$

- N electrons
- $N$ single particle orbitals $\phi_{i}$
- ~ o(1) basis functions for each $\phi_{i}$ if

$$
\phi_{i}\left(\mathbf{r}_{j}\right)=\sum_{l} c_{l} f_{l}\left(\mathbf{r}_{j}\right)
$$

## Cost proportional to $\mathbf{N}^{\mathbf{2}}$

## Cost of evaluating $\Psi_{T}$

$$
\Psi_{T}(\mathbf{R})=\exp [J(\mathbf{R})] \sum_{n} c_{n} D_{n}^{\uparrow}\left\{\phi_{i}\left(\mathbf{r}_{j}\right)\right\} D_{n}^{\downarrow}\left\{\phi_{i}\left(\mathbf{r}_{j}\right)\right\}
$$

- N electrons
- ~ o(1) single particle localised orbitals $\phi_{i}$, if $\phi_{i}$ is localised
- ~ o(1) basis functions for each $\phi_{i}$ if

$$
\phi_{i}\left(\mathbf{r}_{j}\right)=\sum_{l} c_{l} f_{l}\left(\mathbf{r}_{j}\right)
$$

## Cost proportional to $\mathbf{N}$ (Linear scaling)

## Cost of evaluating Energy E

Variance of E is proportional to $\mathrm{N} \rightarrow$
Cost of total energy proportional to $\mathbf{N}^{\mathbf{2}}$

## HOWEVER <br> Variance of E/atom is proportional to $1 / \mathrm{N} \rightarrow$

Cost of energy/atom independent on N !
(relevant to free energies in phase transitions, surface energies, ....)

## B-splines (blips)

- Defined on a uniform grid
- Localised: $f(x)=0$ for $|x|>2$
- Continuous with first and second derivative continuous

$$
f(x)=1-\frac{3}{2} x^{2}+\frac{3}{4}|x|^{3} \quad 0 \leq|x| \leq 1
$$

$$
=\frac{1}{4}(2-|x|)^{3} \quad 1 \leq|x| \leq 2
$$

Grid spacing $a$ :

$$
X_{i}=i a
$$

$$
\Theta\left(x-X_{i}\right)=f\left(\left(x-X_{i}\right) / a\right)
$$

Blips in three dimensions:

$$
\Theta\left(\mathbf{r}-\mathbf{R}_{i}\right)=\Theta\left(x-X_{i}\right) \Theta\left(y-Y_{i}\right) \Theta\left(z-Z_{i}\right)
$$

Single-particle orbital representation:

$$
\psi_{n}(\mathbf{r})=\sum_{i} a_{n i} \Theta\left(\mathbf{r}-\mathbf{R}_{i}\right)
$$

For each position $r$ there are only 64 blip functions that are non zero. By contrast, in a plane wave representation:

$$
\psi_{n}(\mathbf{r})=\sum_{\mathbf{G}} c_{n \mathbf{G}} e^{i \mathbf{G} \cdot \mathbf{r}}
$$

The number of plane waves in MgO is $\sim 3000$ per atom! (HF pseudopotentials, 100 Ha PW cutoff)

## Approximate equivalence between blips and plane waves

One dimension:

$$
\begin{aligned}
& \uparrow \Theta_{j}(x) \equiv \Theta(x-j a) \\
& a=L / N
\end{aligned}
$$

$$
\begin{aligned}
& \phi_{n}(x)=e^{2 \pi i n x / L}=e^{i k_{n} x} \quad k_{n}=2 \pi n / L ; \quad k_{\max }=\pi / a \\
& \chi_{n}(x)=\sum_{j=0}^{N-1} \Theta_{j}(x) e^{2 \pi i j n / N} \quad-\frac{1}{2} N+1 \leq n \leq \frac{1}{2} N
\end{aligned}
$$

$$
\begin{aligned}
&\left\langle\phi_{n} \mid \chi_{m}\right\rangle=\int_{0}^{L} d x \sum_{j=0}^{N-1} \theta_{j}(x) e^{2 \pi j i m / N} e^{-i k_{n} x}=\quad k_{n}=\frac{2 \pi n}{a N} \\
&= \sum_{j=0}^{N-1} e^{2 \pi i(m-n) j / N} \int_{0}^{L} \theta_{j}(x) e^{2 \pi i n(j-x /(a) / N} d x=(\text { use PBC }) x-j a \rightarrow x, \Theta_{j} \rightarrow \Theta_{0} \\
&= \sum_{i=0}^{N-1} e^{2 \pi i(m-n) j / N} \int_{0}^{L} \theta_{0}(x) e^{-2 \pi i n x / a N} d x=N \delta_{n m}^{L} \int_{0}^{L} f(x / a) e^{-2 \pi i n x / a N} d x= \\
&= N \delta_{n m} a \int_{0}^{L / a} f(y) e^{-2 \pi i n y / N} d y=L \delta_{n m} \mid(2 \pi n / N) \\
& \mathscr{H}(q)=\int_{-\infty}^{+\infty} f(x) e^{-i q x} d x=\int_{-2}^{+2} f(x) e^{-i q x} d x=\frac{3}{q^{4}}[3-4 \cos (q)+\cos (2 q)]
\end{aligned}
$$

Now consider:

$$
\alpha_{n}=\frac{\left\langle\phi_{n} \mid \chi_{n}\right\rangle}{\sqrt{\left\langle\phi_{n} \mid \phi_{n}\right\rangle^{2}\left\langle\chi_{n} \mid \chi_{n}\right\rangle^{2}}}
$$

If $\chi_{n}$ and $\phi_{n}$ were proportional then $\alpha_{n}=1$, and blip waves would be identical to plane waves. Let's see what value of $\alpha_{n}$ has for a few values on $n$.

| $n$ | $k_{n}$ | $\alpha_{n}$ |
| :---: | :---: | :---: |
| 0 | 0 | 1.00 |
| 1 | $\pi / 6 a$ | 0.9986 |
| 3 | $\pi / 2 a$ | 0.9858 |
| 6 | $\pi / a$ | 0.6532 |

Take $N=12$, for example

$$
\begin{aligned}
& k_{n}=2 \pi n / N a \\
& k_{\max }=\pi / a
\end{aligned}
$$

Therefore if we replace $\phi_{n}$ with $\chi_{n}$ we make a small error at low $k$ but maybe a significant error for large values of $k$. Let's do it anyway, then we will come back to the size of the error and how to reduce it.

## ATC

## Representing single particle orbitals in 3 d

$$
\begin{aligned}
& \psi_{n}(\mathbf{r})=\sum_{\mathbf{G}} c_{n \mathbf{G}} e^{i \mathbf{G} \cdot \mathbf{r}} \\
& \psi_{n}(\mathbf{r})=\sum_{j} a_{n j} \Theta_{j}(\mathbf{r}) \\
& \chi_{\mathbf{G}}(\mathbf{r})=\sum_{j} \Theta_{j}(\mathbf{r}) e^{i \mathbf{G} \cdot \mathbf{R}_{j}} \\
& e^{i \mathbf{G} \cdot \mathbf{r}} ; \gamma_{\mathbf{G}} \chi_{\mathbf{G}}(\mathbf{r})
\end{aligned}
$$

$$
\psi_{n}(\mathbf{r}) ; \sum_{\mathbf{G}} \gamma_{\mathrm{G}} c_{n \mathrm{G}} \chi_{\mathrm{G}}(\mathbf{r})=\sum_{\mathrm{G}} c_{n \mathrm{G}} \gamma_{\mathrm{G}} \sum_{j} \Theta_{j}(\mathbf{r}) e^{i \mathbf{G} \cdot \mathbf{R}_{j}}=\sum_{j} a_{n j} \Theta_{j}(\mathbf{r})
$$

$$
a_{n j}=\sum_{\mathbf{G}} \gamma_{\mathbf{G}} C_{n \mathbf{G}} e^{i \mathbf{G} \cdot \mathbf{R}_{j}} \quad \text { (note that in DA \& MJG, PRB 70, } 16101 \text { (2004) } \gamma_{\mathbf{G}} \text { should be } 1 / \gamma_{\mathbf{G}} \text { ) }
$$

## Improving the quality of the B-spline representation

Reduce $a$ and achieve better quality

May not be good enough

$$
a=\pi / k_{\max }
$$

Blips are systematically improvable

Example: Silicon in the $\beta-\mathrm{Sn}$ structure, 16 atoms, $1^{\text {st }}$ orbital

$$
\alpha_{n}=\frac{\left\langle\psi_{n}^{B-\text { splines }} \mid \psi_{n}^{P W}\right\rangle}{\sqrt{\left\langle\psi_{n}^{B-\text { splines }} \mid \psi_{n}^{B-\text { splines }}\right\rangle\left\langle\psi_{n}^{P W} \mid \psi_{n}^{P W}\right\rangle}}
$$

|  | $\psi$ | $\Delta \psi$ | $\nabla_{\mathrm{x}} \psi$ | $\nabla_{\mathrm{y}} \psi$ | $\nabla_{\mathrm{z}} \psi$ |
| :--- | :--- | :--- | :--- | :--- | :--- |
| $\alpha_{1}\left(a=\pi / k_{\max }\right)$ | .999977 | .892597 | .991164 | .991164 | .996006 |
| $\alpha_{1}\left(a=\pi / 2 k_{\max }\right)$ | .99999998 | .995315 | .999988 | .999988 | .999993 |

## IJCL

## Energies in QMC (eV/atom)

(Silicon in $ß-S n$ structure, 16 atoms, 15 Ry PW cutoff)

|  | PW | Blips $\left(a=\pi / k_{\max }\right)$ | Blips $\left(a=\pi / 2 k_{\max }\right)$ |
| :--- | :--- | :--- | :--- |
| $\mathrm{E}_{\mathrm{k}}(\mathrm{DFT})$ | 43.863 |  |  |
| $\mathrm{E}_{\text {loc }}(\mathrm{DFT})$ | 15.057 |  |  |
| $\mathrm{E}_{\mathrm{nl}}(\mathrm{DFT})$ | 1.543 |  |  |
| $\mathrm{E}_{\mathrm{k}}(\mathrm{VMC})$ | $43.864(3)$ | $43.924(3)$ | $43.862(3)$ |
| $\mathrm{E}_{\text {loc }}(\mathrm{VMC})$ | $15.057(3)$ | $15.063(3)$ | $15.058(3)$ |
| $\mathrm{E}_{\mathrm{nl}}(\mathrm{VMC})$ | $1.533(3)$ | $1.525(3)$ | $1.535(3)$ |
| $\mathrm{E}_{\text {tot }}(\mathrm{VMC})$ | $-101.335(3)$ | $-101.277(3)$ | $-101.341(3)$ |
| $\sigma(\mathrm{VMC})$ | 4.50 | 4.74 | 4.55 |
| $\mathrm{~T}(\mathrm{~s} /$ step $)$ | 1.83 | 0.32 | 0.34 |
| $\mathrm{E}_{\text {tot }}(\mathrm{DMC})$ | $-105.714(4)$ | $-105.713(5)$ | $-105.716(5)$ |
| $\sigma(\mathrm{VMC})$ | 2.29 | 2.95 | 2.38 |
| $\mathrm{~T}(\mathrm{~s} /$ step $)$ | 2.28 | 0.21 | 0.25 |

## Energies in QMC (eV/atom)

(MgO in NaCl structure, 8 atoms, 200 Ry PW cutoff)

|  | PW | Blips $\left(a=\pi / k_{\max }\right)$ | Blips $\left(a=\pi / 2 k_{\max }\right)$ |
| :--- | :--- | :--- | :--- |
| $\mathrm{E}_{\mathrm{k}}(\mathrm{VMC})$ | $178.349(49)$ | $178.360(22)$ | $178.369(22)$ |
| $\mathrm{E}_{\text {loc }}(\mathrm{VMC})$ | $-225.191(50)$ | $-225.128(24)$ | $-225.177(23)$ |
| $\mathrm{E}_{\mathrm{nl}}(\mathrm{VMC})$ | $-17.955(25)$ | $-17.974(11)$ | $-17.976(11)$ |
| $\mathrm{E}_{\text {tot }}(\mathrm{VMC})$ | $-227.677(8)$ | $-227.648(4)$ | $-227.669(4)$ |
| $\sigma(\mathrm{VMC})$ | 14 | 15 | 14.5 |
| $\mathrm{~T}(\mathrm{~s} /$ step $)$ | 7.8 | $5.6 \times 10^{-2}$ | $7.1 \times 10^{-2}$ |

Blips and plane waves give identical results, blips are 2 orders of magnitude faster on 8 atoms, 3 and 4 order of magnitudes faster on 80 ad 800 atoms respectively (on 800 atoms: Blips 1 day, PW 38 years)

## Achieving linear scaling

Maximally localised Wannier functions
(Marzari Vanderbilt)
[Williamson et al., PRL, 87, 246406 (2001)]

Unitary transformation:

$$
\phi_{i}(\mathbf{r})=\sum_{m=1}^{N} c_{m i} \psi_{m}(\mathbf{r})
$$

Linear scaling obtained by truncating orbitals to zero outside their localisation region.

And:

$$
\begin{aligned}
& D\left\{\phi_{i}(\mathbf{r})\right\}=D\left\{\psi_{m}(\mathbf{r})\right\} \\
& \qquad \begin{aligned}
\Psi_{T}(\mathbf{R}) & =\exp [J(\mathbf{R})] \sum_{n} c_{n} D_{n}^{\uparrow}\left\{\psi_{i}\left(\mathbf{r}_{j}\right)\right\} D_{n}^{\downarrow}\left\{\psi_{i}\left(\mathbf{r}_{j}\right)\right\} \\
& =\exp [J(\mathbf{R})] \sum_{n} c_{n} D_{n}^{\uparrow}\left\{\phi_{i}\left(\mathbf{r}_{j}\right)\right\} D_{n}^{\downarrow}\left\{\phi_{i}\left(\mathbf{r}_{j}\right)\right\}
\end{aligned}
\end{aligned}
$$

$$
E_{L}(\mathbf{R})=\Psi_{T}(\mathbf{R})^{-1} \ddot{\varphi} \Psi_{T}(\mathbf{R})
$$

The VMC and DMC total energies are exactly invariant with respect to arbitrary (non singular) linear combinations of single-electron orbitals! Transformation does not have to be unitary.

Arbitrary linear combination:

$$
\phi_{i}(\mathbf{r})=\sum_{m=1}^{N} c_{m i} \psi_{m}(\mathbf{r})
$$

And:

$$
D\left\{\phi_{m}(\mathbf{r})\right\}=D\left\{c_{i j}\right\} D\left\{\psi_{i}(\mathbf{r})\right\} \quad \text { Provided } \quad D\left\{c_{i j}\right\} \neq 0
$$

## AMCI

We have set of orbitals $\psi_{n}(\mathbf{r})$ extending over region $\Omega$

Maximise "localisation weight" $P$ :

$$
P=\int_{\omega} d \mathbf{r}|\phi(\mathbf{r})|^{2} / \int_{\Omega} d \mathbf{r}|\phi(\mathbf{r})|^{2}
$$

Express $P$ as: $P=\sum_{m, n} c_{m}^{*} A_{m n}^{\omega} c_{n} / \sum_{m, n} c_{m}^{*} A_{m n}^{\Omega} c_{n}$

Linear scaling obtained by truncating localised orbitals to zero outside their localisation region $\omega$. Then for given $\mathbf{r}$ number of nonzero orbitals $\phi_{m}(\mathbf{r})$ is $O(1)$.
where: $\quad A_{m n}^{\omega}=\int_{\omega} d \mathbf{r} \psi_{m}^{*} \psi_{n}, \quad A_{m n}^{\Omega}=\int_{\Omega} d \mathbf{r} \psi_{m}^{*} \psi_{n}$
Weight $P$ is maximal when $c_{n}$ eigenvector of $\sum_{n} A_{m n}^{\omega} c_{n}=\lambda_{\alpha} \sum_{n} A_{m n}^{\Omega} c_{n}$ associated with maximum eigenvalue $\lambda_{\max }$, and $P=\lambda_{\max }$

## Localisation weight in MgO

Convergence of localisation weight $\mathrm{Q}=1-\mathrm{P}$ in MgO . Squares: present method ( D . Alfè and M . J. Gillan, J. Phys. Cond. Matter 16, L305-L311 (2004))

Diamonds: MLWF (Williamson et al. PRL, 87, 246406 (2001)

## Localisation weight in MgO

Convergence of localisation weight $\mathrm{Q}=1-\mathrm{P}$ in MgO . Squares: present method (D. Alfè and M. J. Gillan, J. Phys. Cond. Matter 16, L305-L311 (2004))

Diamonds: MLWF (Williamson et al. PRL, 87, 246406 (2001)

## VMC and DMC energies in MgO

Convergence of VMC energy.
Squares: Non-orthogonal orbitals.
Diamons: MLWF

Convergence of DMC energy, nonorthogonal orbitals

## VMC and DMC energies in MgO

Convergence of VMC energy.
Squares: Non-orthogonal orbitals.
Diamons: MLWF

Convergence of DMC energy, nonorthogonal orbitals

Spherical cutoff at 6 a.u on a 7.8 a.u. cubic box (64 atoms):

- WF evaluation 4 times faster
- Memory occupancy 4 times smaller
